

Module 4: Assignment Instructions

Assignments must be completed on your own. Any evidence that students have collaborated on assignments will be considered a violation of the academic honesty code.

In this assignment you will add content to the order page of your web site that has a form to order tickets to the park. In addition, you will use JavaScript to write the rides with their image and info to the page using a function (showRides()) and create two additional functions that will **eventually** display more details about each ride (rideInfo()) and will be used to submit the tickets form that you will create in this assignment (orderTics())

Step 1: Update all HTML pages

1. Update the <title> tag in all HTML files to be "LastName: Assign4".
 2. Add the link element to all HTML files to connect them to the javascript file.
-

Step 2: External JavaScript file (Filename: amuse_script.js):

Create an external javascript file to do the following:

1. Function rideInfo():
 - i. This is a function that will take a **parameter** that is called when the user clicks the ride's name.
 - ii. This function will create an alert that displays the **ID** of the ride **clicked** – **info.html** page.
 - iii. Check Figures1,2,3.
2. Function showRides():
 - i. Create:
 - i. Array rideNames[] – elements are the names of each ride.
 - ii. Array rideDescriptions[] – elements are the descriptions about each ride.

- iii. Array `rideImages[]` – elements are the FILENAMES to the images for each athlete (such as `"images/ride1.jpg"`).
 - ii. Create a function that will **write** the ride's names, pictures, & information to the webpage using a loop. Instead of writing each line, use arrays to output the information that changes when putting the information on the page. You must use the arrays and the loop correctly for full credit on this part of the assignment. This page will look the same as before.
 - a. Update the information to use the arrays created above. You will use the names, descriptions, and images arrays.
 - b. Use a for loop to output this information.
 - c. Make sure that the alt attribute is updated correctly for each ride's image.
 - iii. Remove the HTML that created this information from the rides page.
 - iv. Make sure the JavaScript writes this information to the correct spot – **rides.html**.
 - v. Styles should still affect this information as previously styled. Check Figure 4.
3. Function `orderTics()`:
- i. Create a function that is called when the form is **submitted** – **order.html**.
 - ii. This function will create an alert that displays "Your total price is: \$35".
 - iii. Check Figure 5.

Figure 1: info.html page after linking to the JS file

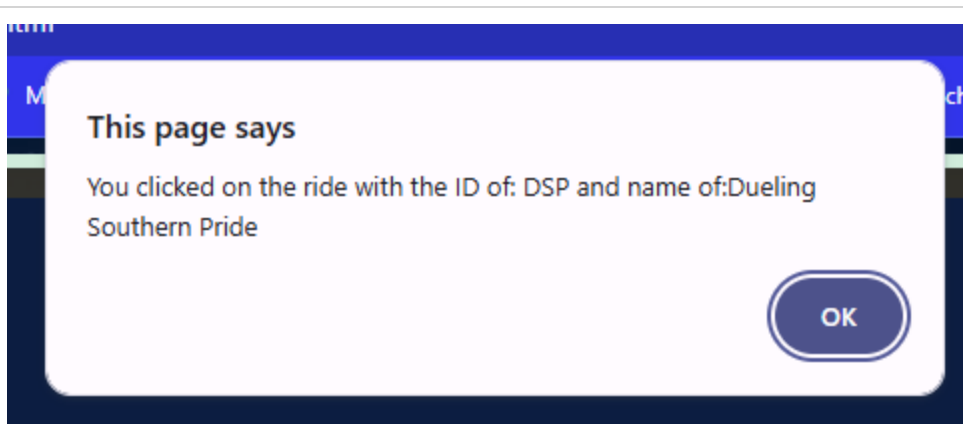

Figure 2: the alert window after clicking on the first ride

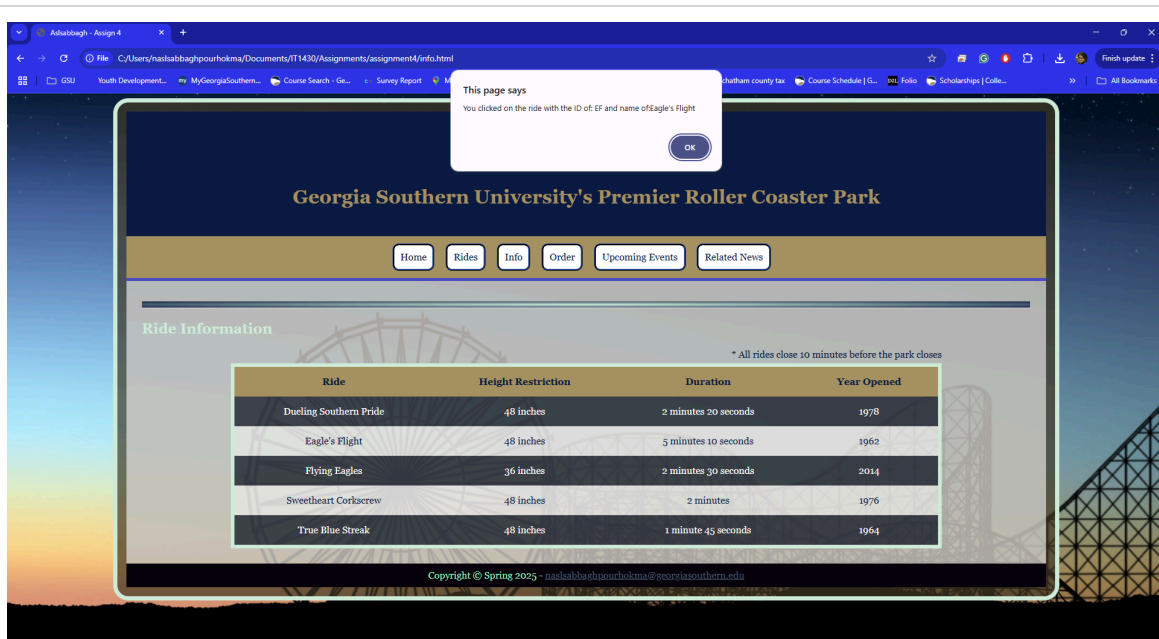

Figure 3: info.html page after clicking on the second ride name (zoomed out).

Figure 4: rides.html page after removing HTML content and using the js

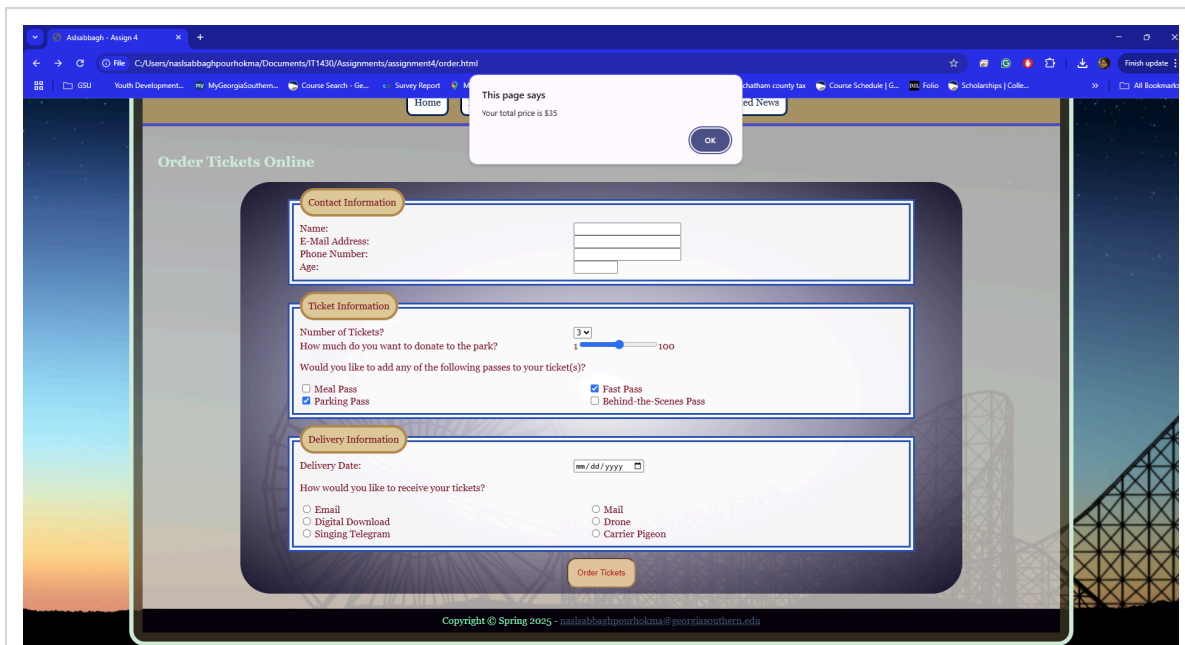

Figure 5: order.html page after clicking on submit button

Step 3: Submission Instructions:

- Place your name, due date and assignment number **in comments** at the top of each page (HTML, CSS, JavaScript).
- All HTML pages must validate to green status using the W3C Validators. <https://validator.w3.org>
- The CSS page must validate to green status using the W3C validator. <https://jigsaw.w3.org/css-validator/>
- Submit all files in a folder (*LastName_Assign4*) that is zipped to the Assignment 4 dropbox on Folio.

Assignment Due Date

Check the course schedule to get the assignment due date
